Physical Security Interoperability Alliance IP Media Device API Specification Version 1.1 Revision 1 12 November 2009

Revision History	Description	Date	Ву
Version 1.0 Revision 1	Initial version	2008-09-11	PSIA IP Video Group
Version 1.0 Revision 2	Removed login/logout, 'getRTSPToken'; fixed numbering (section 15/16)	2008-12-11	PSIA IP Video Group
Version 1.0 Revision 3	Conversion to REST model	2009-02-16	PSIA IP Video Group
Version 1.0 Revision 4	Addition of XML data and minimal device requirements	2009-02-16	PSIA IP Video Group
Version 1.0 Revision 5	First reviewable draft	2009-02-16	PSIA IP Video Group
Version 1.0 Revision 6	Incorporation of comments from first review round, pulled more content from 0.9 draft specification. Added Scope section	2009-03-07	PSIA IP Video Group
Version 1.0 Revision 7	Corrections, expanded examples.	2009-03-13	PSIA IP Video Group
Version 1.1 Revision 1	Modified required services, resources, and fields. Corrections.	2009-11-12	PSIA IP Video Group

1. Overview

This document specifies an interface that enables physical security and video management systems to communicate with various IP media devices in a standardized way. This eliminates the need for device driver customization in order to achieve interoperability among products from different manufacturers. The intent of this specification is to improve the interoperability of IP-based physical security products from different vendors.

2. Scope

As the first PSIA specification adhering to the PSIA Service Model, this document defines the mandatory PSIA services for <u>ALL PSIA specifications</u> (future PSIA specifications will reference this IP <u>Media Device Specification for these mandatory services</u>). In addition, it defines several services and subordinate resources that are specific to Media Devices.

All of the Mandatory Services and the Mandatory Resources of both Mandatory and Optional services are complete in this version of the specification. In contrast, several of the optional resources may undergo some changes in the next version of the specification based on lessons learned during implementation of this first version. These optional resources are considered preliminary and are indicated as such in the resource definition notes.

All of the services and resources under the Custom service are to be considered preliminary and there is a high probability that they will be moved into another service as and when applicable. Use of resources currently under the Custom service is not discouraged, as every attempt will be made to provide backward compatibility to these existing resources in subsequent PSIA specifications. For example, the Custom/Event/Notification services and resources are usable in their current form and might be retained as is but moved into a different service when a PSIA specification addressing events is published.

Suggestions for corrections to this version of the specification and additions to the protocol should be submitted to the PSIA Forum's IP Media Specification area located at:

http://www.psialliance.org/forums/

Please post your suggested correction or addition in an applicable thread.

3. Problem Definition

Security and/or network management applications require the ability to change configurations and control the behaviors of IP media devices – cameras, encoders, decoders, recorders, etc. This functionality can be achieved by sending a standard HTTP(S) request to the unit. The scope of this specification is to define all HTTP(S) application programming interfaces (APIs) for media devices and their functionality; namely, for setting/retrieving various configurations, and controlling device behaviors.

4. Conformance

This document conforms to the PSIA Service model, which describes the methods used for service discovery and introspection. The mandatory service and resources requirements defined by this model are implied in addition to any requirements defined herein.

The required services defined below are the fundamental services for all PSIA specifications and are intended to be referenced by other specifications.

The optional services defined are specific to IP media devices.

4.1. Service Requirements

The following table describes the service requirements of the PSIA Service Model.

REQ	Service URL	Notes
✓	/PSIA	
✓	/PSIA/System	
	/PSIA/System/Storage	Not all IP media devices support storage.
✓	/PSIA/System/Network	
	/PSIA/System/IO	
	/PSIA/System/Audio	
	/PSIA/System/Video	
	/PSIA/System/Serial	
	/PSIA/Diagnostics	
✓	/PSIA/Security	
	/PSIA/Security/AAA	
	/PSIA/Streaming	
	/PSIA/PTZ	
	/PSIA/Custom/MotionDetection	
	/PSIA/Custom/Event	

4.2. Resource Requirements

The following resources are required for the implemented services.

4.2.1. /PSIA Root Service

5. Media Streaming

There are several methods to stream live video and audio from an IP media device to a client.

5.1. Streaming with RTP and RTSP

An IP media device must support streaming of video and audio content using RTSP [RFC2326], SDP [4566] and RTP [RFC3550, RFC3551].

RTP provides a framework for the transport of real-time media. RTP is flexible and has been used successfully to transmit telephone signals over IP, real-time media from voice and audio teleconferencing over low-bandwidth links to high-definition television over high-bandwidth connections. Its flexibility and widespread acceptance have made RTP a de facto standard since its inception.

RTP has been adopted as a standard by the Internet Engineering Task Force (IETF). RTP has also been adopted by the International Telecommunications Union (ITU) as part of its H.323 series of recommendations.

RTP can stream media over both unicast and multicast networks. As defined, RTP focuses on streaming and leaves streaming control and session establishment to other standard protocols that are addressed below. RTP is deliberately incomplete: additional profiles specify algorithms and frameworks for media playout and timing regeneration, synchronization between media streams, error concealment and correction or congestion control. RTP also does not specify mappings between payload and media types.

RTP is based on two important principles: application-level framing and the end-to-end principle. Application-level framing, as it applies to media transport, implies that the transmission protocol should make a minimum set of assumptions about the requirements of the data being streamed, leaving it up to the application (sender and receivers) to frame (packetizer) content and manage unreliable transmission. The end-to-end principle implies that intelligence lies with the sender and receiver. The network is considered a stateless, "dumb" packet-delivery system. Combined together, these two principles provide a unifying framework for real-time audio/video transport, satisfying most applications directly yet being malleable for those applications that stretch its limits.

RTSP is a control protocol designed for serving multimedia sessions. RTSP can act as a "network remote control" for media servers (including surveillance equipment). RTSP is similar in syntax and operation to HTTP.

RTSP defines a means to deliver RTP streaming using TCP. This can be useful for streaming data in situations where loss cannot be tolerated, such as when downloading a video clip or streaming important metadata.

SDP is a protocol that describes a media session. Because of the format of a session description, certain information is always needed. SDP is used to convey the transport addresses on which media flows, the format of the media, the corresponding RTP payload formats and profiles and the times when the session as well as the media durations.

There is some overlap between RTSP and the SDP: some of the information available in the session description is also available via RTSP commands.

5.1.1. Use of RTP and RTCP

It is highly recommended that IP media devices implement the sending of RTCP sender reports in order to facilitate time synchronization and for network diagnosis and reporting. The sender report must contain an absolute NTP timestamp relative to Jan 1, 1900 with its corresponding RTP timestamp.

It is highly recommended that IP media devices send a BYE RTCP packet when disconnecting from a session, even in unicast. This information permits a client to distinguish between voluntary and involuntary session termination.

5.1.2. Use of RTSP and SDP

Media Request URI

An IP media device makes streaming channels accessible in RTSP via an associated RTSP URI. This URI has the form:

rtsp://<address>:<port>/<path>?<paramName>=<paramValue>&...

An RTSP URI consists of a base path and a set of parameter name-value pairs.

For delivery of live streaming content, the RTSP URIs have the following form:

rtsp://<address>:<port>/PSIA/Streaming/channels/ID?<parameters>

Where the path corresponds to the REST resource for a given streaming channel as defined in section 7.12.3. The set of valid parameters corresponds to the query strings and their types in section 7.12.5. This correspondence is specified in order to allow introspection on the supported set of query parameters for a given streaming channel.

Example:

rtsp://192.168.99.11:554/PSIA/Streaming/channels/123456?videoCodecType=MJPEG&rotationDegr ee=90

Minimal Implementation

The default port number for an IPMD RTSP server is 554.

All clients and server must implement all required features of the minimal RTSP implementation described in Appendix D of RFC 2326.

The DESCRIBE method must be supported and must support SDP as the description format according to Appendix C of RFC 2326.

The RTP/AVP profile defined in RFC 3551 must be supported. For SETUP requests, the "Transport", "client_port", "server_port", "source", "ssrc" and "RTP-Info" headers must be supported.

If multicast is supported, the "destination", "port" and "ttl" headers **must** be supported.

Supported Transport Protocols

IP media device RTSP servers are required to support UDP as a transmission transport protocol.

It is highly recommended that IP media device RTSP servers support TCP as a transmission transport protocol. If TCP is supported, the RTSP server must support interleaving of RTP/RTCP packets over the RTSP TCP connection.

It is highly recommended that IP media device RTSP servers support UDP multicast transport.

Keep Alive

The RTSP server must indicate the session timeout: any clients who do not notify the server that they are still alive within this time limit (and periodically afterwards) should have their corresponding media streams terminated.

An IP media device RTSP server must support the RTSP OPTIONS method and RTCP receiver reports for keepalives. The media device should treat any valid RTSP command from the client as a "keep-alive" request and maintain an active session accordingly. Supporting GET_PARAMETER for keepalives is optional.

RTSP Authentication

IP media device RTSP servers must support HTTP basic authentication. It is highly recommended that RTSP servers support HTTP digest authentication (RFC 2069).

The set of valid user names and passwords required to access an RTSP session is configured in /System/AAA. Permission granularity is left to the device implementation.

5.1.3. RTP Packetization Rules for Codecs

Rules for the description and packetization of codecs required for interoperability over RTSP, SDP and RTP are defined in additional IETF RFC documents. The following table lists some of the commonly used codecs for video surveillance applications:

Codec	Normative Reference	Mime Type(s)	RFC
	Video		
Motion JPEG	ISO/IEC IS 10918-1 ITU-T Rec. T.81	video/jpeg	RFC 2435
MPEG-2	ISO/IEC 13818-2	video/MPV	RFC 2250
MPEG-4 SP/ASP	ISO/IEC 14496-2:2004	video/MP4V-ES	RFC 3016 RFC 3640
H.264 AVC	ISO/IEC 14496-10:2005 ITU-T Rec. H.264:2005	video/H264	RFC 3984
H.264 SVC	ISO/IEC 14496-10 Amd 3 ITU-T Rec. H.264 Annex G	video/H264-SVC	IETF Draft

Codec	Normative Reference	Mime Type(s)	RFC	
Audio				
G.726 ¹	ITU-T Rec. G.726	audio/G726-40 audio/G726-32 audio/G726-24 audio/G726-16 audio/AAL2-G726-40 audio/AAL2-G726-32 audio/AAL2-G726-24 audio/AAL2-G726-16	RFC 3551	
MPEG-1 Layer II & III	ISO/IEC 11172-3:1993	audio/mpeg	RFC 2250	
AAC	ISO/IEC 14496-3	audio/aac-lbr audio/aac-hbr	RFC 3640	

For RTP packetization, any additional codecs must conform to payload format defined in an IETF specification or draft specification if present.

5.2. Streaming using HTTP Server Push

It is highly recommended that an IP media device support streaming of video and audio content over an HTTP server push connection. See <code>/PSIA/Streaming/channels/ID/http</code> in section 7.12.5 for a description of HTTP streaming.

¹ The ordering of G.726 code words in RTP packets is currently ambiguous. According to ITU-T Recommendation I.366.2 Annex E for ATM AAL2 transport, G.726 code words should be packed in "big-endian" order (network byte order) into the payload bytes of an RTP packet. This conflicts, however, with the latest IETF revised draft specification for RTP audio and video profiles that specifies a "little-endian" packing order and delegates different MIME types for the big-endian packing ("AAL2-G726-32"). It should be noted that there is no straightforward means to detect the packing order from the data itself. As some equipment manufacturers have already implemented RTP transport with the older packing order, assuring interoperability between devices is problematic. It appears, however, that the "big-endian" packing order for G.726 is widely accepted in the industry. Implementations must interpret and produce the MIME type that is appropriate for the G.726 codeword ordering according to RFC 3551. In order to integrate equipment that does not correctly implement the standard, it must be possible to identify the source with the RTSP "Server" header field or the SDP "a=tool" field in order to modify the code word order for further transmission or decoding.

6. Common Data Types

The XML Data Blocks described in this document contains annotations that describe the properties of the field. For a complete definition, see the XML schema definitions.

The following information is inserted into the comments to describe the data carried in the field:

Annotation	Description
req	Required field.
opt	Optional field. For data uploaded to the device, if the field is present but the device does not support it, it should be ignored.
dep	This field is required depending on the value of another field.
ro	Read-only. For XML data that is both read and written to the device, this field is only present in XML returned from the device. If this field is present in XML uploaded to the device, it should be ignored.
wo	Write-only. This field is only present in XML that can be uploaded to the device. This field should never be present in data returned from the device. [This is used for uploading passwords].
xs: <type></type>	A type defined in XML Schema Part 2: Datatypes Second Edition, see http://www.w3.org/TR/xmlschema-2

Note that XML structures that are optional may have required fields. This means that the entire XML block is optional, however if it is present the required fields are mandatory.

6.1. Built-in Types

Туре	Description
Douglasta	A positive numerical value indicating the data transmission rate in symbols per second.
BaudRate	Value is >=0.
	Example: 9600
Color	RGB triplet in hexadecimal format (3 bytes) without the preceding "0x".
Coloi	Example: "FF00FF"
Consulinate	A positive numerical value in pixels. A coordinate pair of 0,0 (x,y) indicates the bottom-left corner of the video image.
Coordinate	Value is >=0.
	Maximum value is dependent on video resolution.
FPS	Frame rate multiplied by 100.
113	Example: 2500 [PAL]
ID	ID from service model.
IPv4 Address	Notation is xxx.xxx.xxx
IFV4 Address	Example: 3.137.217.220
IPv6 Address	Notation is xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx using CIDR notation.
IF VO Address	Example: 2001:0db8:85a3:0000:0000:8a2e:0370:7334
MAC	MAC Address
WAC	Notation is aa:bb:cc:dd:ee:ff with 6 hex bytes.
	A positive numerical value indicating the number of hops (routers) that traffic is
TTL	permitted to pass through before expiring.
	Value is >=0.

6.2. Receiver Address

Notes:

- Depending on the value of <addressingFormatType>, either the <hostName> or the IP address fields will be used to locate the NTP server.
- Use of IPv4 or IPv6 addresses depends on the value of the <ipVersion> field in /System/Network/interfaces/ID/ipAddress.

6.3. TimeBlockList

<TimeBlockList> holds a set of <TimeBlock> XML that define a set of time ranges.

Notes:

- If <dayOfWeek> is not present the time block is valid every day. No two <TimeBlock> in the same list should provide the same <dayOfWeek>.
- If the <bitString> tag is provided, <TimeRange> should not be provided, and vice versa.
- The <bitString> field can be used to reduce the amount of required, transferable XML. The field is a string of 24 bits, where each bit specifies an hour of the day. The left-most bit is hour 0, and the right-most bit is hour 24. A '1' indicates that the specified hour is enabled for event detection and triggering, and a '0' indicates that it is not. Thus, all <bitString> fields must be 24 bits in length.

7. Service Command Details

7.1. /PSIA/System

URI	/PSIA/System			Туре	Service
Function	System services.				
Methods	Query String(s) Inbound Data Return Result			esult	
Notes					

7.1.1. /PSIA/System/reboot

URI	/PSIA/System/reboot Type Resource				
Function	Reboot the device.				
Methods	Query String(s) Inbound Data Return Result				
PUT	<responsestatus></responsestatus>				
Notes	The <responsestatus> XML data is returned before the device proceeds to reboot.</responsestatus>				

7.1.2. /PSIA/System/updateFirmware

URI	/PSIA/System/update	PSIA/System/updateFirmware			Resource
Function	Update the firmware of the device.				
Methods	Query String(s) Inbound Data Return Result				esult
PUT			<responsestatus></responsestatus>		
Notes	After successful completion of this API, the <responsestatus> XML data is returned, and the device proceeds to reboot.</responsestatus>				

7.1.3. /PSIA/System/configurationData

URI	/PSIA/System/configurationData			Туре	Resource	
Function	The function is used to get or set the configuration data for the device. This is opaque data that can be used to save and restore the device configuration.					
Methods	Query String(s) Inbound Data Re				esult	
GET			Opaque data			
PUT		Opaque Data	<responsestatus></responsestatus>			
Notes	Configuration data is device-dependent – it may be binary or any other format. Client may use the HTTP Accept: header field to inform server what formats are expected. May reboot device after configuration data is applied.					

7.1.4. /PSIA/System/factoryReset

URI	/PSIA/System/factor	PSIA/System/factoryReset			Resource	
Function	This function is used to	This function is used to reset the configuration for the device to the factory default.				
Methods	Query String(s) Inbound Data Ret			eturn R	lesult	
PUT	Mode <re< th=""><th colspan="2"><responsestatus></responsestatus></th></re<>		<responsestatus></responsestatus>			
Notes	Two factory reset modes are supported: "full" resets all device parameters and settings to their factory values. "basic" resets all device parameters and settings except the values in /PSIA/System/Network and /PSIA/Security. The default mode is "full". The device may be rebooted after it is reset.					

7.1.5. /PSIA/System/deviceInfo

URI	/PSIA/System/device	PSIA/System/deviceInfo			Resource
Function	This function is used to get or set device information.				
Methods	Query String(s) Inbound Data Return Result				
GET			<deviceinfo></deviceinfo>		
PUT		<deviceinfo></deviceinfo>	<responsestatus></responsestatus>		
Notes	Some fields are read-only and may not be set. If these fields are present in the inbound XML block, they are ignored. For the <deviceinfo> uploaded to the device during a PUT operation, all fields are considered optional and any fields that are not present in the inbound XML are not changed on the device. This allows setting of the fields individually without having to load</deviceinfo>				ds are are not naving to load

7.4.30. Examples

Example: Getting the Network Settings

```
GET /PSIA/System/Network HTTP/1.1
HTTP/1.1 200 OK
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<NetworkInterfaceList version="1.0" xmlns="urn:psialliance-org">
  <NetworkInterface>
      <id>1</id>
      <IPAddress>
          <ipVersion>v4</ipVersion>
          <addressingType>static</addressingType>
          <ipAddress>3.137.217.220</ipAddress>
          <subnetMask>255.255.255.0
          <DefaultGateway>
              <ipAddress>3.137.217.0</ipAddress>
          </DefaultGateway>
          <PrimaryDNS>
              <ipAddress>3.137.218.37</ipAddress>
          </PrimaryDNS>
          <SecondaryDNS>
              <ipAddress>3.137.217.15</ipAddress>
          </SecondaryDNS>
      </IPAddress>
  </NetworkInterface>
   <NetworkInterface>
      <id>2</id>
      <IPAddress>
          <ipVersion>v4</ipVersion>
          <addressingType>dynamic</addressingType>
      <Wireless>
          <enabled>true</enabled>
          <wirelessNetworkMode>intrastructure</wirelessNetworkMode>
          <WirelessSecurity>
              <securityMode>WPA-personal</securityMode>
                 <algorithmType>AES</algorithmType>
                 <sharedKey>ac34587bc8a8fff7a</sharedKey>
              </WPA>
          </WirelessSecurity>
      </Wireless>
   </NetworkInterface>
</NetworkInterfaceList>
```

Example: Setting the IP Address

```
PUT /PSIA/System/Network/interfaces/1/ipAddress HTTP/1.1
...
HTTP/1.1 200 OK
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx

<?xml version="1.0" encoding="UTF-8"?>
```

Function	Query the status of an output port.				
Methods	Query String(s)	Inbound Data		Return Result	
GET				<iop< th=""><th>ortStatus></th></iop<>	ortStatus>
Notes	See /PSIA/System/IO/status for an explanation of the fields.				

7.5.9. IO Port Examples

Example: Set up IO Port Triggering

NOTE: The following example requires that input port event detection and output port triggering be enabled and scheduled with <code>/PSIA/Custom/Event/triggers</code> and <code>/PSIA/Custom/Event/schedule</code> beforehand.

The following commands set up one device input port and two device output ports (the number of IO ports is device-dependent) in the following manner:

- Input port 111 will continuously trigger an event (specified in the example in section 7.15.16) when the input signal is high. The input port should stop triggering this event when the input signal reverts back to low.
- Output port 222 will have a default low signal when not being triggered. When triggered, it will switch to a high signal. The port should automatically revert to a low signal when triggering stops, but in the case that a device cannot support this feature the port can be manually reset (see 7.15.16).
- Output port 333 will have a default low signal when not being triggered. When triggered, it will send a "pulse" of the opposite signal high, in this case for a duration of 3 seconds and then switch back to a low signal.

Example: Manually Trigger and Reset an Output Port

Use the following command to manually set to a low signal. Note that this feature has no effect on future event detection and triggering – e.g. if output port 1 is automatically triggered in the future, it will override the behavior set here.

or, the same without the XML payload:

```
PUT /PSIA/System/IO/outputs/222/trigger?outputState=low HTTP/1.1
```

7.6. /PSIA/System/Audio

URI	/PSIA/System/Audio			Туре	Service
Methods	Query String(s)	Inbound Data	Return Result		
Notes	Audio service.				

7.6.1. /PSIA/System/Audio/channels

Example: Getting Streaming Channel Properties

The following is an example of a GET on the streaming parameters of a particular channel that has been preconfigured by the IP media device. Depending on the device, some streaming channels may be already preconfigured for the device while others may require that channels be manually configured before use.

```
GET /PSIA/Streaming/channels/444 HTTP/1.1
HTTP/1.1 200 OK
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<StreamingChannel version="1.0" xmlns="urn:psialliance-org">
  <id>444</id>
  <channelName>Input 1 MPEG-4 ASP</channelName>
  <enabled>true<</enabled>
   <Transport>
      <rtspPortNo>554<</rtspPortNo>
      <maxPacketSize>1446<</maxPacketSize>
      <ControlProtocolList>
          <ControlProtocol>
              <streamingTransport>RTSP</streamingTransport>
          </ControlProtocol>
          <ControlProtocol>
              <streamingTransport>HTTP</streamingTransport>
          </ControlProtocol>
  </Transport>
   <Video>
      <enabled>true</enabled>
      <videoInputChannelID>2</videoInputChannelID>
      <videoCodecType>MPEG4</videoCodecType>
      <videoScanType>progressive</videoScanType>
      <videoResolutionWidth>640</videoResolutionWidth>
      <videoResolutionHeight>480</videoResolutionHeight>
      <videoPositionX>0</videoPositionX>
      <videoPositionY>0</videoPositionY>
      <videoQualityControlType>CBR</videoQualityControlType>
      <constantBitRate>2000</constantBitRate>
      <maxFrameRate>2500</maxFrameRate>
      <keyFrameInterval>1000</keyFrameInterval>
      <rotationDegree>0</rotationDegree>
      <mirrorEnabled>false</mirrorEnabled>
      <snapShotImageType>JPEG</snapShotImageType>
   </Video>
   <Audio>
      <enabled>false
      <audioInputChannelID>2</audioInputChannelID>
      <audioCompressionType>G.726</audioCompressionType>
      <audioBitRate>24</audioBitRate>
      <audioSamplingRate>8</audioSamplingRate>
   </Audio>
</StreamingChannel>
```

Example: Getting Streaming Capabilities

```
GET /PSIA/Streaming/channels/444/capabilities HTTP/1.1
...
HTTP/1.1 200 OK
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx

</Audio>
```

Example: Setting Streaming Channel Properties

The following command sets the streaming parameters of an MJPEG stream with G.711 audio compression over RTSP and HTTP on streaming ID 555. The MJPEG codec is configured to encode a window of 640x480 positioned at 120,100 in the sensor field.

Some of the fields, such as <videoInputChannelID> and <audioInputChannelID> are already preconfigured for this streaming channel.

```
PUT /PSIA/Streaming/channels/333 HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx

       <startDateTime> <!-- opt, xs:datetime -->
                                                                </startDateTime>
      <elapsedTime> <!-- opt, xs:integer, seconds --> </elapsedTime
<br/><bandwidth> <!-- opt, xs:integer, in kbps --> </bandwidth>
                          <!-- opt, xs:integer, seconds --> </elapsedTime>
   </StreamingSessionStatus>
</StreamingSessionStatusList>
```

7.12.5. /PSIA/Streaming/channels/<ID>/http

URI	/PSIA/Streaming/channels/ID/http			Туре	Resource		
Function	Access a live stream via http.						
Methods	Query String(s)	Inbound Data	R	eturn R	esult		
GET	videoCodecType videoScanType videoResolutionWidth videoResolutionHeight videoPositionX videoPositionY videoQualityControlType constantBitRate		Stream over HTTP				
POST	fixedQuality vbrUpperCap vbrLowerCap maxFrameRate keyFrameInterval rotationDegree mirrorEnabled snapShotImageType	<video></video>	Stream over HTTP				
Notes	This function is used to request a stream from the device using HTTP or HTTPS. This API uses HTTP server-push with the MIME type multipart/x-mixed-replace. HTTP streaming must be enabled on the channel. To determine the format of the video returned, either the parameters in <video> or the query string values are used, depending on the capabilities of the encoder.</video>						

Example

```
GET /PSIA/Streaming/channels/777/http?videoCodecType=MJPEG HTTP/1.1
...
HTTP/1.1 200 OK
Content-Type: multipart/x-mixed-replace; boundary=<boundary>
--<boundary>
Content-Type: image/jpeg
Content-Length: xxx

Image data for a single frame
--<boundary>
...
```

7.12.6. /PSIA/Streaming/channels/<ID>/picture

URI	/PSIA/Streaming/channels/ID/picture				Resource	
Function	Get a snapshot of the current in	nage.				
Methods	Query String(s)	Inbound Data	Ret	urn Re	sult	
GET	videoResolutionWidth videoResolutionHeight videoPositionX		Picture over HTTP			
POST	videoPositionY rotationDegree mirrorEnabled snapShotImageType	<video></video>	Picture over HTTP			
Notes	All devices must support <snapshotimagetype> of "JPEG". To determine the format of the picture returned, either the parameters in <video> or the query string values are used, or, if the Accept: header field is present in the request and the server supports it, the picture is returned in that format. For supported values, query /PSIA/Streaming/channels/ID/picture/capabilities. Examples: GET /PSIA/Streaming/channels/123456/picture?snapShotImageType=JPEG POST /PSIA/Streaming/channels/123456/picture <?xml version="1.0" encoding="UTF-8"?> <video></video> GET /PSIA/Streaming/channels/123456/picture</video></snapshotimagetype>					

7.12.7. /PSIA/Streaming/channels/<ID>/requestKeyFrame

Notes	The <timeblocklist> in the schedule defines when the patrol should be active.</timeblocklist>						

7.13.21. Patrol Examples

Example: Create a patrol

The following commands are two examples of setting up patrols. Here is the list of PTZ channel 1 presets used for the settings.

```
GET /PSIA/PTZ/channels/1/presets HTTP/1.1
HTTP/1.1 200 OK
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<PTZPresetList version="1.0" xmlns="urn:psialliance-org">
  <PTZPreset>
     <id>1</id>
     PresetName>Left Wing</presetName>
  </PTZPreset>
  <PTZPreset>
     <id>2</id>
     PresetNameRight Wing</presetName</pre>
  </PTZPreset>
  <PTZPreset>
     <id>3</id>
     </PTZPreset>
  <PTZPreset>
     <id>4</id>
     <Alley</pre>
  </PTZPreset>
  <PTZPreset>
     <id>5</id>
     </PTZPreset>
  <PTZPreset>
     <id>6</id>
     etName>East Entrance</presetName>
  </PTZPreset>
</PTZPresetList>
```

Use the following command to create a "Parking Garage" patrol has the behavior "Left wing" @ 5 sec, "Right wing" @ 5 sec, "Gate" @ 10 sec, "Alley" @ 3 sec, and repeat:

```
POST /PSIA/PTZ/channels/1/patrols HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<PTZPatrol version="1.0" xmlns="urn:psialliance-org">
   <patrolName>Parking Garage</patrolName>
   <resumeType>relative</resumeType>
   <PatrolSequenceList>
       <PatrolSequence>
           oresetID>1</presetID>
           <delay>5000</delay>
       </PatrolSequence>
       <PatrolSequence>
           cpresetID>2</presetID>
           <delay>5000</delay>
       </PatrolSequence>
       <PatrolSequence>
           setID>3</presetID>
           <delay>10000</delay>
       </PatrolSequence>
       <PatrolSequence>
           setID>4</presetID>
           <delay>3000</delay>
       </PatrolSequence>
   </PatrolSequenceList>
</PTZPatrol>
```

Use the following command to create a "Perimeter Scan" patrol has the behavior "North entrance" @ 7 sec, "East entrance" @ 7 sec, "Alley" @ 7 sec, and repeat.

```
POST /PSIA/PTZ/channels/1/patrols HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<PTZPatrol version="1.0" xmlns="urn:psialliance-org">
   <patrolName>Perimeter Scan</patrolName>
   <resumeType>relative</resumeType>
   <PatrolSequenceList>
       <PatrolSequence>
           setID>5</presetID>
           <delay>7000</delay>
       </PatrolSequence>
       <PatrolSequence>
           oresetID>7</presetID>
           <delay>7000</delay>
       </PatrolSequence>
       <PatrolSequence>
           setID>4</presetID>
           <delay>7000</delay>
       </PatrolSequence>
   </PatrolSequenceList>
</PTZPatrol>
```

Example: Schedule a Patrol

Assume that the "Parking Garage" patrol has been assigned to ID 7. The following command schedules the patrol to operate from 9:00 am to 7:00 pm Monday, Wednesday, Friday, and 9:00 am to 11:00 pm on the weekends:

```
PUT /PSIA/PTZ/channels/1/patrols/7/schedule HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<TimeBlockList>
  <TimeBlock>
      <dayOfWeek>1</dayOfWeek>
      <TimeRange>
          <beginTime>09:00:00
          <endTime>19:00:00</endTime>
      </TimeRange>
  </TimeBlock>
  <TimeBlock>
      <dayOfWeek>3</dayOfWeek>
      <TimeRange>
         <beginTime>09:00:00
          <endTime>19:00:00</endTime>
      </TimeRange>
  </TimeBlock>
  <TimeBlock>
      <dayOfWeek>5</dayOfWeek>
      <TimeRange>
          <beginTime>09:00:00</beginTime>
             <endTime>19:00:00</endTime>
      </TimeRange>
  </TimeBlock>
<TimeBlockList>
```

Assume that the "Perimeter Scan" patrol has been assigned to ID 8. The following command schedules the patrol to operate from 11:00 pm to 6:00 am everyday:

```
PUT /PSIA/PTZ/channels/1/patrols/8/schedule HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<TimeBlockList>
   <TimeBlock>
      <dayOfWeek>6</dayOfWeek>
      <TimeRange>
          <beginTime>23:00:00</beginTime>
          <endTime>06:00:00</endTime>
      </TimeRange>
   </TimeBlock>
   <TimeBlock>
      <dayOfWeek>7</dayOfWeek>
      <TimeRange>
          <beginTime>23:00:00</beginTime>
          <endTime>06:00:00</endTime>
      </TimeRange>
   </TimeBlock>
</TimeBlockList>
```

7.14./PSIA/Custom/MotionDetection

MotionDetectionRegion XML Block

7.14.4. Motion Detection Example

Set up Motion Detection

The following command configures two rectangular detection regions, with one "masked" region on video input channel ID 777. Example assumes a resolution of 1920x1080 and a grid motion detection algorithm:

- Motion detection is enabled with a granularity of a 12x8 grid this means the detection region coordinates will ultimately be defined by a grid of 96 regions. For a resolution of 1920x1080, this means that each "granule" will be 160x135 pixels (1920/12 x 1080/8). (If a coordinate doesn't exactly match the configured granularity, it should be mapped internally to the nearest possible point)
- A sample will be taken every 2 frames for motion detection and motion must be detected for at least one second before triggering an event notification (motion must be stopped for at least one second to stop the triggering).
- Two detection regions are defined, the second containing an inner/overlapping region that is disabled. Region 1 occupies the bottom-left 8 granules. Region 2 occupies the top-right 8 granules, with the top-right-most corner granule (region 3) disabled by use of the <maskEnabled> tag.

```
PUT /PSIA/Custom/Analytics/motionDetection/777 HTTP/1.1

  <inputIOPortID> <!-- dep, xs:string;id -->
                                                           </inputIOPortID>
                             <!-- dep, if <eventType> is "vmd" -->
  <DetectionRegionList>
      <DetectionRegionEntry> <!-- req -->
         <regionID>
                             <!-- req, xs:string;id -->
                                                            </regionID>
         <sensitivityLevel>
                             <!-- req, xs:integer, 0..100 --> </sensitivityLevel>
         <detectionThreshold> <!-- req, xs:integer, 0..100 --> </detectionThreshold>
      </DetectionRegionEntry>
  </DetectionRegionList>
</EventNotificationAlert>
```

Example

The following is an example of an HTTP event stream that pushes a VMD event from video channel 1.

```
GET /PSIA/Custom/Event/notification/alertStream HTTP/1.1
HTTP/1.1 200 OK
MIME-Version: 1.0
Content-Type: multipart/mixed; boundary="<boundary>"
--<boundary>
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<EventNotificationAlert version="1.0" xmlns="urn:psialliance-org">
  <ipAddress>3.137.217.220</ipAddress>
  <portNo>80</portNo>
  otocol>HTTP
  <macAddress>00:14:22:43:D5:D4</macAddress>
  <channelID>1</channelID>
  <dateTime>2009-03-11T15:27Z</dateTime>
  <activePostCount>1</activePostCount>
  <eventType>VMD</eventType>
  <eventState>active</eventState>
  <eventDescription>Motion alarm
  <DetectionRegionList>
      <DetectionRegionEntry>
         <regionID>2</regionID>
          <sensitivityLevel>67</sensitivityLevel>
          <detectionThreshold>43</detectionThreshold>
          <detectionLevel>49</detectionLevel>
      </DetectionRegionEntry>
  </DetectionRegionList>
</EventNotificationAlert>
--<boundary>
```

7.15.14. HTTP Notification Alert

This function is used to send an event notification from the media device to the monitoring web server or management system via HTTP or HTTPS. A connection will be established with the client only when an event occurs. The destination address is determined by the <HttpHostNotificationList> block.

URI	https:// <ipaddress>:<portno>/<url></url></portno></ipaddress>			
Function	HTTP notification alert request.			
Methods	Query String(s)	Inbound Data	Return Result	
POST		Notification Alert		
	Either GET or POST can be used. If GET is used, the corresponding query string parameters are provided in place of the inbound XML. If Post is used, the inbound XML is provided in place of the corresponding query string parameters.			
	The "DeviceID=" and "DeviceName=" fields are taken from the <deviceinfo> settings for the device.</deviceinfo>			
	The <parameterformattype> tag indicates whether XML or query string parameters should be used for this API.</parameterformattype>			
	The <pre><pre>colType> tag under <httphostlist> determines whether HTTP or HTTPS is used for this API.</httphostlist></pre></pre>			
	The <portno> tag under <httphostlist> determines the port number to be used for the notification alert.</httphostlist></portno>			
	The <portno> and <pre><pre><pre> tags in the alert are provided for a client application to connect/manage the device after it sends out this notification.</pre></pre></pre></portno>			
	The <addressingformattype> tag under <httphostlist> determines whether <ipaddress>/IPAddress or <ipv6address>/IPv6Address is used.</ipv6address></ipaddress></httphostlist></addressingformattype>			
	The <url> tag under <httphostlist> indicates the URL base to be used for the alert.</httphostlist></url>			
Notes	If <eventtype>/EventType refers to an input-port-related event, the <inputioportid> tag or InputIOPortID parameter must be provided.</inputioportid></eventtype>			
	If <eventtype>/EventType refers to a motion-related event, the <detectionregionlist> block or RegionIndexX parameter(s) must be provided if detection regions have been defined. If the motion event is for a full-screen configuration, these region indexes should not be provided.</detectionregionlist></eventtype>			
	The <sensitivitylevel>/SensitivityLevelX and <detectionthreshold>/DetectionThresholdX parameters are used to indicate the current values of the activity detection at the time that the notification is sent out.</detectionthreshold></sensitivitylevel>			
	If the alert is for a motion-related event, multiple region indexes may be provided per single API. If query string parameters are used, the format "RegionIndexX" is used where "X" is a number starting with "1" and incrementing by one for every subsequent region index provided.			
	If the httpAuthenticationMethod tag under httpHostList is configured for "MD5 Digest Authentication", the corresponding security values must be stored in the header fields of the HTTP(S) request.			
		ActivePostCount parameter is a ne for every event notification sen

To: ...
Subject: ...

<pre
```

7.15.16. Event Triggering Examples

Example: Trigger Events on IO Port

The command below enables detection for input port 1. When the input signal is detected according to <inputIOPortID>, two event notification responses are used – output port 2 will be triggered for the duration of the input signal detection, and an HTTP server will be notified with the "HTTPS Event Notification Alert". The behavior of this notification is as follows:

- An HTTP(S) notification is sent at detection time, and every 5 seconds after while the signal is present. This is denoted by the <notificationRecurrence> and <notificationInterval> tags. These APIs will have an <eventState> of "active".
- When the input port 1 signal detection stops, one last HTTP(S) notification is sent to the server (again, 5 seconds from the last notification) with an <eventState> of "active".
- After the signal detection stops for input port 1, the device will wait 1 second before starting to detect the signal again for this port (indicated by <intervalBetweenEvents>).

```
POST /PSIA/Custom/Event/triggers HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<EventTrigger version="1.0" xmlns="urn:psialliance-org">
   <eventType>IO</eventType>
   <eventDescription>Input port 1 event detection</eventDescription>
  <inputIOPortID>111</inputIOPortID>
   <intervalBetweenEvents>1</intervalBetweenEvents>
   <EventTriggerNotificationList>
      <EventTriggerNotification>
          <notificationMethod>IO</notificationMethod>
          <outputIOPortID>222</outputIOPortID>
      </EventTriggerNotification>
      <EventTriggerNotification>
          <notificationMethod>HTTP</notificationMethod>
          <notificationRecurrence>recurring</notificationRecurrence>
          <notificationInterval>5000</notificationInterval>
      </EventTriggerNotification>
   </EventTriggerNotificationList>
</EventTrigger>
```

Example: Trigger Syslog from Motion Detection

The command below enables motion detection. When motion is detected, syslog notification is used. The behavior of this notification is as follows:

- A syslog message is sent once at detection time
- A syslog message is sent once when detection stops

The above behavior is result of the <notificationRecurrence> tag. When detection stops the device will immediately start motion detection again, as denoted by the <intervalBetweenEvents> tag.

```
POST /PSIA/Custom/Event/triggers HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx

<pre
```

Example: Schedule event detection and triggering

The command below schedules event detection and triggering from 8:00 am to 6:00 pm and 10:00 pm to 11:00 pm every Monday, Wednesday, and Friday. On Tuesday and Thursday, event detection and triggering is scheduled from 7:00 am to 5:00 pm.

```
PUT /PSIA/Custom/Event/schedule HTTP/1.1
Content-Type: application/xml; charset="UTF-8"
Content-Length: xxx
<?xml version="1.0" encoding="UTF-8"?>
<EventSchedule version="1.0" xmlns="urn:psialliance-org">
